

Heavy quark spectroscopy and accurate prediction of b-baryon masses

Marek Karliner

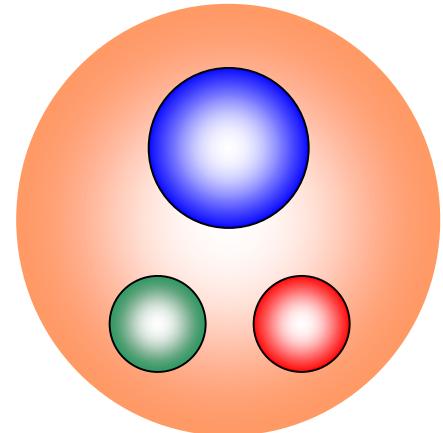

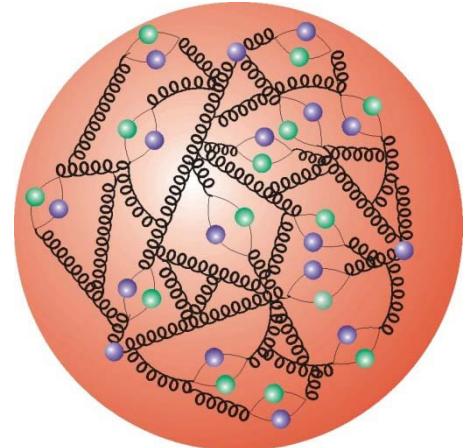

in collaboration with B. Keren-Zur, H.J. Lipkin and J. Rosner

Constituent Quark Models (CQM)

- QCD describes hadrons as valence quarks in a sea of gluons and q-qbar pairs.
- at low E, χ SB
- → quark constituent mass
- hadron can be considered as a bound state of constituent quarks.
- Sakharov-Zeldovich formula:

$$M = \sum_i m_i$$

- the binding & kinetic energies “swallowed” by the constituent quarks masses.

Color Hyperfine (HF) interaction

- 1st correction – color hyperfine (chromo-magnetic) interaction

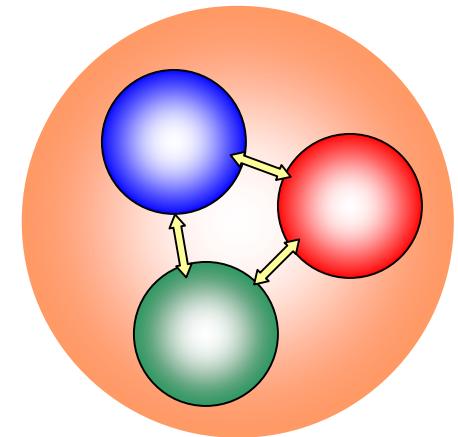

$$M = \sum_i m_i + \sum_{i < j} V^{HF}_{ij}$$

$$V^{HF(QCD)}_{ij} = \nu_0 (\vec{\lambda}_i \cdot \vec{\lambda}_j) \frac{\vec{\sigma}_i \cdot \vec{\sigma}_j}{m_i m_j} \langle \psi | \delta(r_i - r_j) | \psi \rangle$$

- A contact interaction
- Analogous to the EM hyperfine interaction – a product of the magnetic moments.

$$V^{HF(em)}_{ij} \propto \vec{\mu}_i \cdot \vec{\mu}_j = e^2 \frac{\vec{\sigma}_i \cdot \vec{\sigma}_j}{m_i m_j}$$

- In QCD, SU(3) generators take the place of the electric charge.

Constituent Quark Model: *caveat emptor*

- a low energy limit, phenomenological model
- still awaiting derivation from QCD
- far from providing a full explanation of the hadronic spectrum, but it provides excellent predictions for mass splittings and magnetic moments
- assumptions:
 - HF interaction considered as a perturbation
 - → does not change the wave function
 - same masses for quarks inside mesons and baryons.
 - no 3-body effects.

constituent quark masses

- example I:
quark mass differences from baryon mass differences:

constituent quark masses

- example II:

$$\begin{aligned} M_{K^*} - M_K &= v_0 \frac{\left(\lambda_u \cdot \lambda_{\bar{s}} \right)}{m_u m_s} \left[(\sigma_u \cdot \sigma_{\bar{s}})_{K^*} - (\sigma_u \cdot \sigma_{\bar{s}})_K \right] \langle \psi | \delta(r) | \psi \rangle \\ &= 4v_0 \frac{\left(\lambda_u \cdot \lambda_{\bar{s}} \right)}{m_u m_s} \langle \psi | \delta(r) | \psi \rangle \end{aligned}$$

- extracting quark masses ratio:

$$\frac{M_{K^*} - M_K}{M_{D^*} - M_D} = \frac{4v_0 \frac{\left(\lambda_u \cdot \lambda_{\bar{s}} \right)}{m_u m_s} \langle \psi | \delta(r) | \psi \rangle}{4v_0 \frac{\left(\lambda_u \cdot \lambda_{\bar{c}} \right)}{m_u m_c} \langle \psi | \delta(r) | \psi \rangle} \approx \frac{m_c}{m_s}$$

TABLE I - Quark mass differences from baryons and mesons

quark mass difference is the same
in mesons and baryons

$$\langle m_i - m_j \rangle_{dBar} \approx \langle m_i - m_j \rangle_{dMes}$$

but depends on the spectator quark
→ challenge to npQCD

MK & Lipkin, hep-ph/0307243

color hyperfine splitting in baryons

- The Σ (uds) baryon HF splitting:

- Σ^* : total spin 3/2 -
u and d at relative spin – 1
 - Σ : isospin – 1
 - Symmetric under exchange of u and d
 - u and d at relative spin – 1

$$(\vec{\sigma}_u \cdot \vec{\sigma}_d)_{\Sigma^*} = (\vec{\sigma}_u \cdot \vec{\sigma}_d)_{\Sigma}$$

- the ‘ud’ pair does not contribute to the HF splitting

$$M_{\Sigma^*} - M_{\Sigma} = 6v_0 \frac{(\vec{\lambda}_u \cdot \vec{\lambda}_s)}{m_u m_s} \langle \psi | \delta(r_{ij}) | \psi \rangle$$

Quark mass ratio from HF splittings in mesons and baryons

$$\left(\frac{m_c}{m_s}\right)_{Bar} = \frac{M_{\Sigma^*} - M_\Sigma}{M_{\Sigma_c^*} - M_{\Sigma_c}} = 2.84 = \left(\frac{m_c}{m_s}\right)_{Mes} = \frac{M_{K^*} - M_K}{M_{D^*} - M_D} = 2.81$$

$$\left(\frac{m_c}{m_u}\right)_{Bar} = \frac{M_\Delta - M_p}{M_{\Sigma_c^*} - M_{\Sigma_c}} = 4.36 = \left(\frac{m_c}{m_u}\right)_{Mes} = \frac{M_\rho - M_\pi}{M_{D^*} - M_D} = 4.46$$

New type of mass relations with more heavy flavors

$$\left(\frac{\frac{1}{m_u^2} - \frac{1}{m_u m_c}}{\frac{1}{m_u^2} - \frac{1}{m_u m_s}}\right)_{Bar} = \frac{M_{\Sigma_c} - M_{\Lambda_c}}{M_\Sigma - M_\Lambda} = 2.16 \approx \left(\frac{\frac{1}{m_u^2} - \frac{1}{m_u m_c}}{\frac{1}{m_u^2} - \frac{1}{m_u m_s}}\right)_{Mes} = \frac{(M_\rho - M_\pi) - (M_{D^*} - M_D)}{(M_\rho - M_\pi) - (M_{K^*} - M_K)} = 2.10$$

Similar relation for bottom baryons
→ prediction for Σ_b mass

$$\frac{M_{\Sigma_b} - M_{\Lambda_b}}{M_\Sigma - M_\Lambda} = \frac{(M_\rho - M_\pi) - (M_{B^*} - M_B)}{(M_\rho - M_\pi) - (M_{K^*} - M_K)} = 2.51$$

→ $M_{\Sigma_b} - M_{\Lambda_b} = 194 \text{ MeV}$

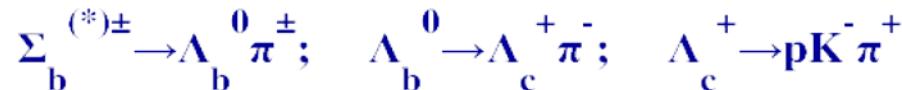

(MK & Lipkin, hep-ph/0307243)

Observation of New Heavy Baryon Σ_b and Σ_b^*

This web page summarizes the results of the search for new heavy baryons Σ_b and Σ_b^*

based upon $1fb^{-1}$ of data. The results have been approved as of September 21, 2006.

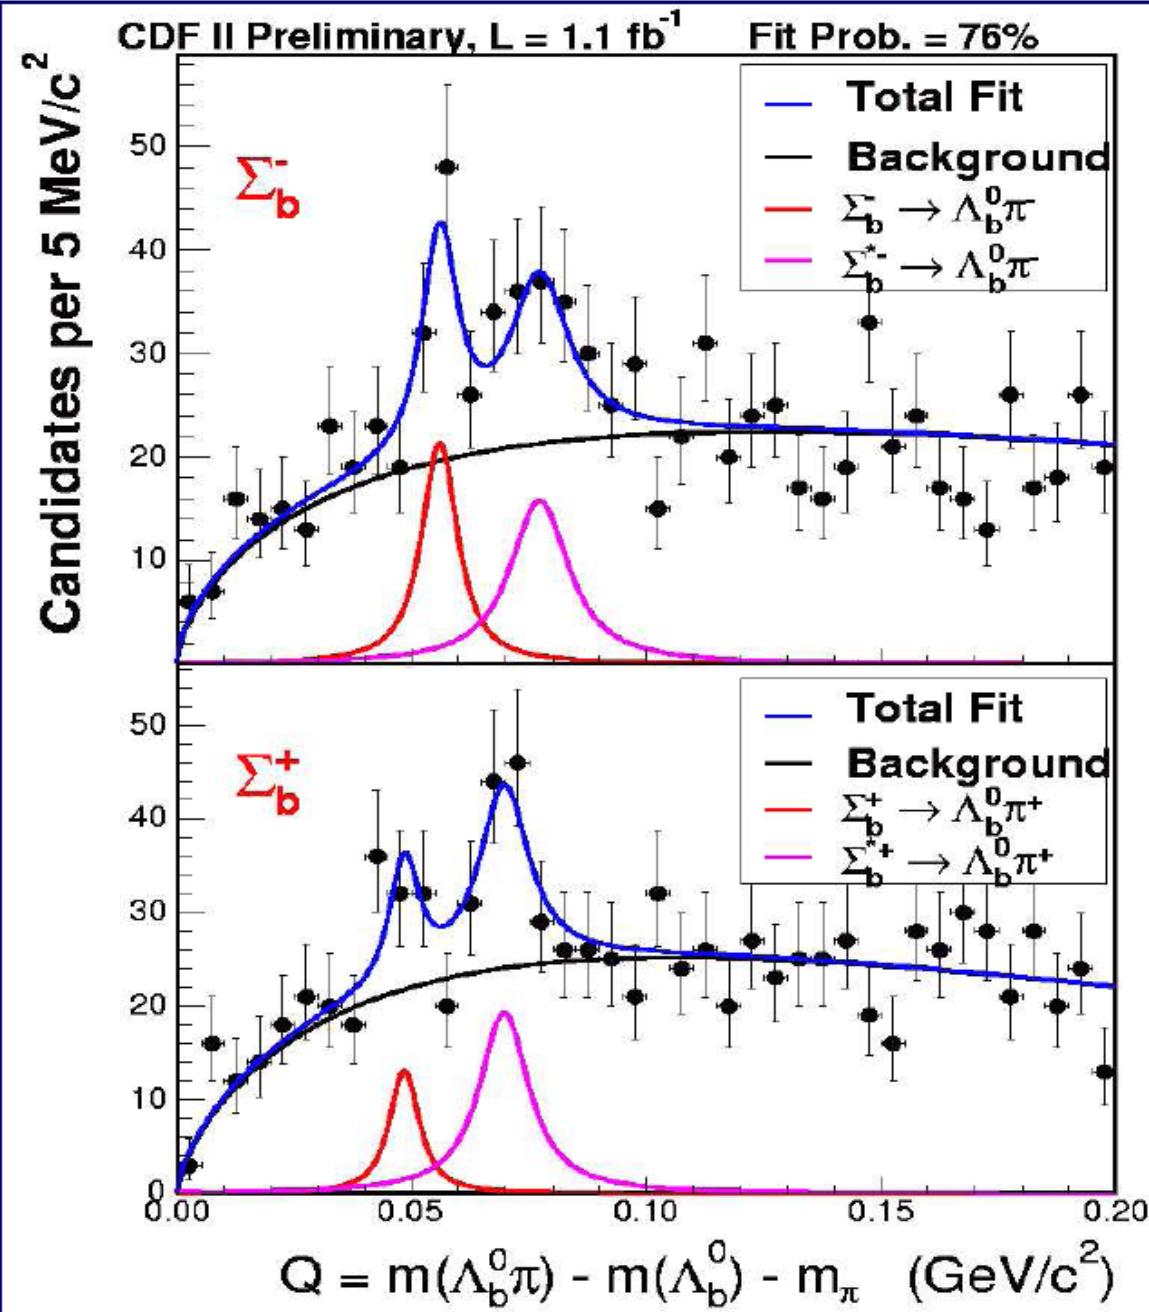

The ratio of likelihoods of the null-hypothesis (no $\Sigma_b^{(*)\pm}$ signal) and the hypothesis of four $\Sigma_b^{(*)\pm}$ states is 2.6×10^{-19} . Using the fully reconstructed decay mode

we measure:

- $m(\Sigma_b^+) = 5808^{+2.0}_{-2.3} (\text{stat.}) \pm 1.7 (\text{syst.}) \text{ MeV/c}^2$
- $m(\Sigma_b^-) = 5816^{+1.0}_{-1.0} (\text{stat.}) \pm 1.7 (\text{syst.}) \text{ MeV/c}^2$
- $m(\Sigma_b^{*+}) = 5829^{+1.6}_{-1.8} (\text{stat.}) \pm 1.7 (\text{syst.}) \text{ MeV/c}^2$
- $m(\Sigma_b^{*-}) = 5837^{+2.1}_{-1.9} (\text{stat.}) \pm 1.7 (\text{syst.}) \text{ MeV/c}^2$

b-baryons

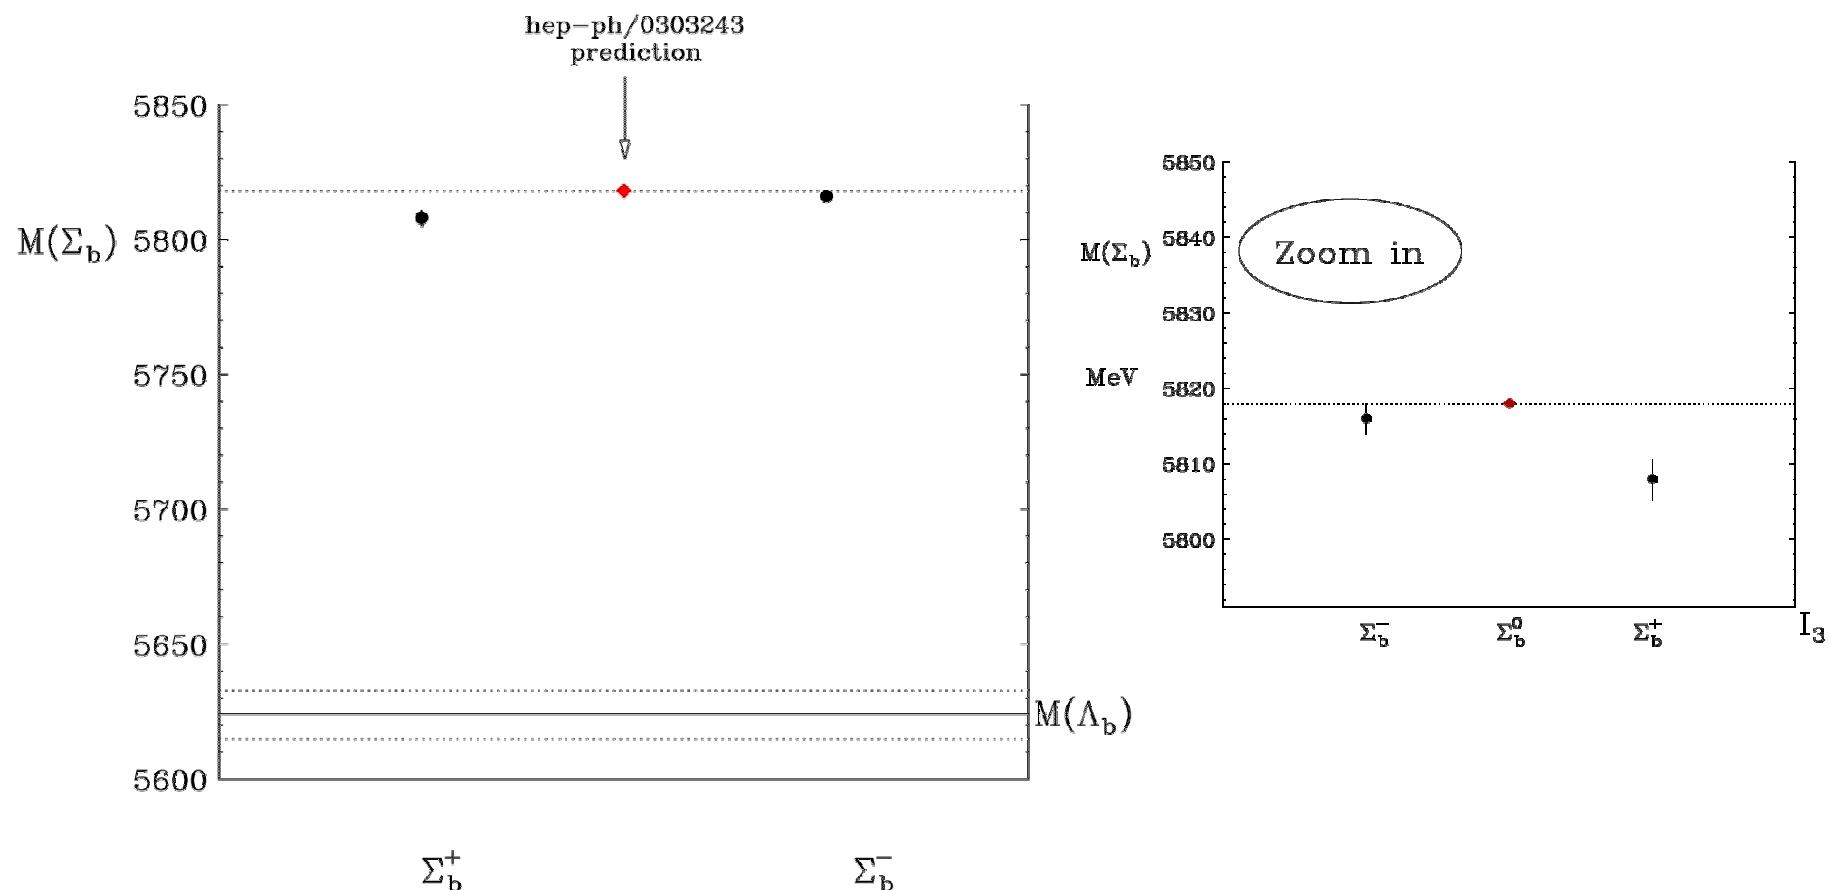

CDF obtained the masses of the Σ_b^- and Σ_b^+ from the decay $\Sigma_b \rightarrow \Lambda_b + \pi$ by measuring the corresponding mass differences |

$$M(\Sigma_b^-) - M(\Lambda_b) = 195.5^{+1.0}_{-1.0} \text{ (stat.)} \pm 0.1 \text{ (syst.) MeV}$$

$$M(\Sigma_b^+) - M(\Lambda_b) = 188.0^{+2.0}_{-2.9} \text{ (stat.)} \pm 0.1 \text{ (syst.) MeV}$$

with isospin-averaged mass difference $M(\Sigma_b) - M(\Lambda_b) = 192 \text{ MeV.}$

can rederive without assuming $\text{HF} \sim 1/m_q$

a weaker assumption of same flavor dependence suffices

$$\frac{V_{hyp}(q_i \bar{q}_j)}{V_{hyp}(q_i \bar{q}_k)} = \frac{V_{hyp}(q_i q_j)}{V_{hyp}(q_i q_k)}$$

$$\frac{M_{\Sigma_b} - M_{\Lambda_b}}{(M_\rho - M_\pi) - (M_{B^*} - M_B)} = \frac{M_{\Sigma_c} - M_{\Lambda_c}}{(M_\rho - M_\pi) - (M_{D^*} - M_D)} = \frac{M_\Sigma - M_\Lambda}{(M_\rho - M_\pi) - (M_{K^*} - M_K)}$$

0.32 \approx 0.33 \approx 0.325

also prediction for spin splitting between Σ_b^* and Σ_b |

$$M(\Sigma_b^*) - M(\Sigma_b) = \frac{M(B^*) - M(B)}{M(K^*) - M(K)} \cdot [M(\Sigma^*) - M(\Sigma)] = 22 \text{ MeV}$$

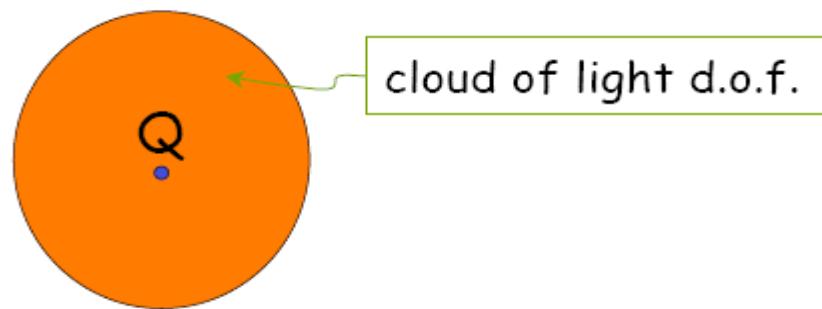

to be compared with 21 MeV from the isospin-average of CDF measurements

$$M(\Sigma_b^{*-}) = 5837_{-1.9}^{+2.1} \text{ (stat.)} \pm 1.7 \text{ (syst.) MeV}$$

$$M(\Sigma_b^{*+}) = 5829_{-1.8}^{+1.6} \text{ (stat.)} \pm 1.7 \text{ (syst.) MeV}$$

Effective meson-baryon supersymmetry

- meson: $Q \bar{q}$ baryon: $Q q\bar{q}$
- in both cases: valence quark coupled to light quark “brown muck” color antitriplet, either a light antiquark ($S=1/2$) or a light diquark ($S=0, S=1$)

- Effective supersymmetry: $T_{LS}^S |\mathcal{M}(\bar{q}Q_i)\rangle \equiv |\mathcal{B}([qq]_S Q_i)\rangle$
- $m(\mathcal{B}) - m(\mathcal{M})$ independent of quark flavor (u,s,c,b) !

- need to first cancel the HF interaction contribution to meson masses:

$$\tilde{M}(V_i) \equiv \frac{3M_{\mathcal{V}_i} + M_{\mathcal{P}_i}}{4}$$

- for spin-zero diquarks:

$$\begin{aligned} M(N) - \tilde{M}(\rho) &= M(\Lambda) - \tilde{M}(K^*) = M(\Lambda_c) - \tilde{M}(D^*) = M(\Lambda_b) - \tilde{M}(B^*) \\ 323 \text{ MeV} &\approx 321 \text{ MeV} \approx 312 \text{ MeV} \approx 310 \text{ MeV} \end{aligned}$$

- for spin-one diquarks need to also cancel HF contribution to baryon masses:

$$\tilde{M}(\Sigma_i) \equiv \frac{2M_{\Sigma_i^*} + M_{\Sigma_i}}{3}; \quad \tilde{M}(\Delta) \equiv \frac{2M_\Delta + M_N}{3}$$

$$\begin{aligned} \tilde{M}(\Delta) - \tilde{M}(\rho) &= \tilde{M}(\Sigma) - \tilde{M}(K^*) = \tilde{M}(\Sigma_c) - \tilde{M}(D^*) = \tilde{M}(\Sigma_b) - \tilde{M}(B^*) \\ 517.56 \text{ MeV} &\approx 526.43 \text{ MeV} \approx 523.95 \text{ MeV} \approx 512.45 \text{ MeV} \end{aligned}$$

Magnetic moments of heavy baryons

- In Λ , Λ_c and Λ_b light q coupled to spin zero
- \rightarrow mag. moments determined by s,c,b moments
- quark mag. moments proportional to their chromomagnetic moments

$$\text{DGG: } \mu_\Lambda = -\frac{\mu_p}{3} \cdot \frac{M_{\Sigma^*} - M_\Sigma}{M_\Delta - M_N} = -0.61 \text{ n.m. } (= \text{EXP})$$

\rightarrow

$$\mu_{\Lambda_c} = -2\mu_\Lambda \cdot \frac{M_{\Sigma_c^*} - M_{\Sigma_c}}{M_{\Sigma^*} - M_\Sigma} = 0.43 \text{ n.m.}$$

$$\mu_{\Lambda_b} = \mu_\Lambda \cdot \frac{M_{\Sigma_b^*} - M_{\Sigma_b}}{M_{\Sigma^*} - M_\Sigma} = -0.067 \text{ n.m.}$$

challenge

Testing confining potentials through meson/baryon HF splitting ratio

B. Keren-Zur, hep-ph/0703011 & Ann. Phys

- from constituent quarks model can derive:

$$\frac{M_{K^*} - M_K}{M_{\Sigma^*} - M_\Sigma} = \frac{4}{3} \frac{\langle \psi | \delta(r_u - r_{\bar{s}}) | \psi \rangle_{meson}}{\langle \psi | \delta(r_u - r_s) | \psi \rangle_{baryon}}$$

- depends only on the confinement potential and quark mass ratio
- can be used to test different confinement potentials

Testing confining potentials through meson/baryon HF splitting ratio

- 3 measurements ($Q = s, c, b$)
- 5 potentials:
 - Harmonic oscillator
 - Coulomb interaction
 - Linear potential
 - Linear + Coulomb
 - Logarithmic

baryon/meson HF splitting ratio

- K meson HF splitting

$$M_{K^*} - M_K = 4v_0 \frac{(\vec{\lambda}_u \cdot \vec{\lambda}_{\bar{s}})}{m_u m_s} \langle \psi | \delta(r_{us}) | \psi \rangle$$

- The Σ (uds) baryon HF splitting:

$$M_{\Sigma^*} - M_\Sigma = 6v_0 \frac{(\vec{\lambda}_u \cdot \vec{\lambda}_s)}{m_u m_s} \langle \psi | \delta(r_{us}) | \psi \rangle$$

- Using the relation:

$$(\vec{\lambda}_u \cdot \vec{\lambda}_s)_{meson} = 2(\vec{\lambda}_u \cdot \vec{\lambda}_s)_{baryon}$$

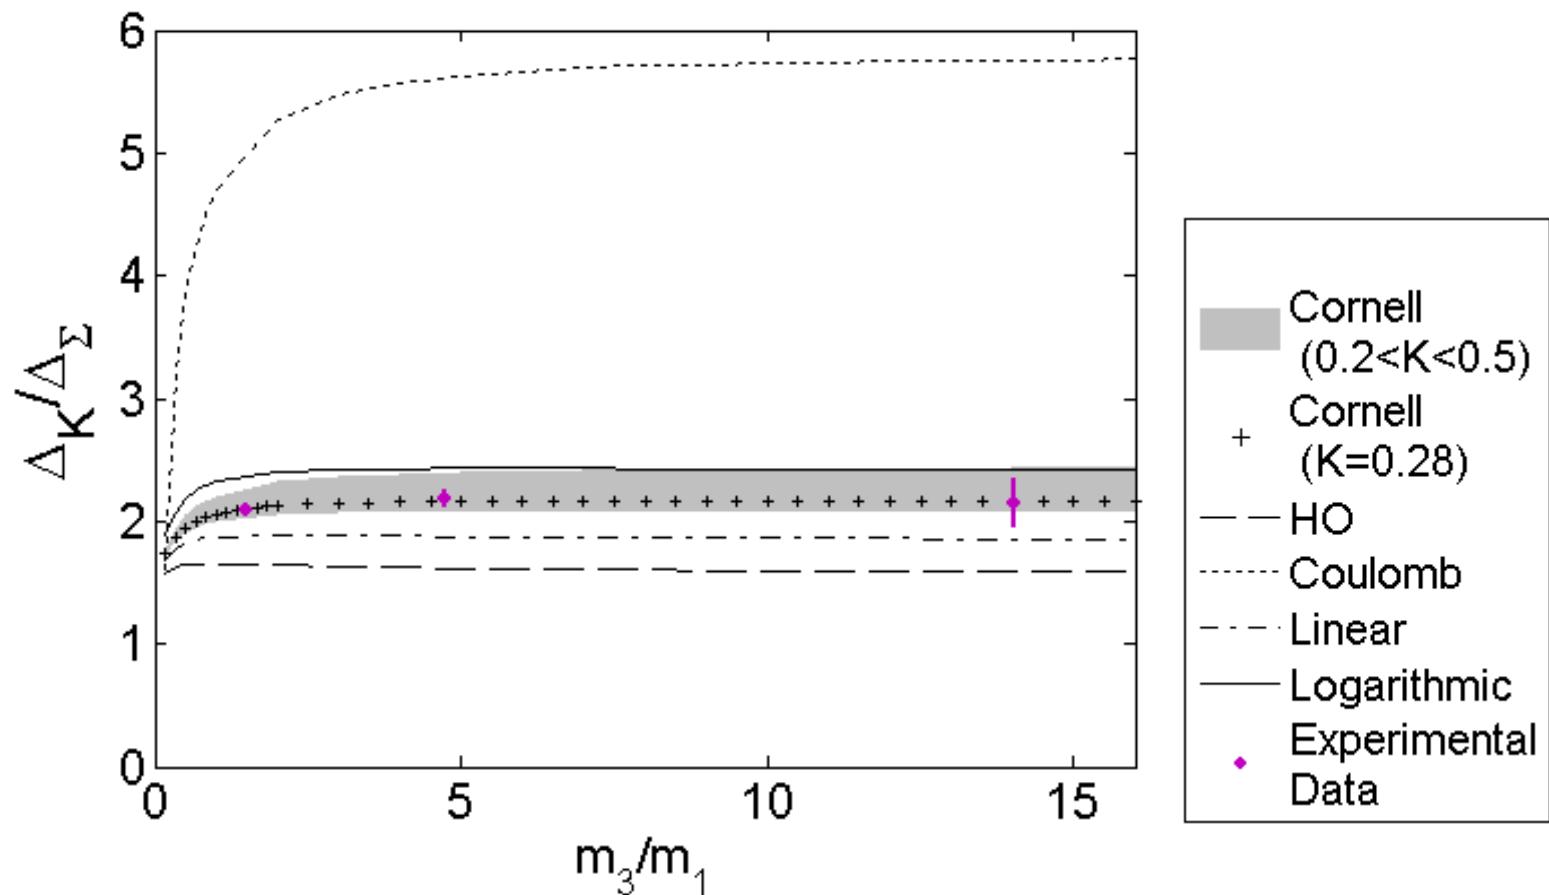

$$\boxed{\frac{M_{K^*} - M_K}{M_{\Sigma^*} - M_\Sigma} = \frac{4}{3} \frac{\langle \psi | \delta(r_{us}) | \psi \rangle_{meson}}{\langle \psi | \delta(r_{us}) | \psi \rangle_{baryon}}}$$

baryon/meson HF splitting ratio

$$\frac{M_{K^*} - M_K}{M_{\Sigma^*} - M_\Sigma} = \frac{4}{3} \frac{\langle \psi | \delta(r_{us}) | \psi \rangle_{meson}}{\langle \psi | \delta(r_{us}) | \psi \rangle_{baryon}}$$

- similar quark content, so can cancel out the HF coupling constant (v_0).
- confinement potential coupling constant and quark mass scale also cancel out
- depends only on the shape of the potential and the ratio of the quark masses.

Hyperfine splitting ratio from potential models vs experiment

hyperfine splitting ratio from potential models vs experiment

	Δ_K/Δ_Σ	$\Delta_D/\Delta_{\Sigma_c}$	$\Delta_B/\Delta_{\Sigma_b}$

Predicting the mass of Ξ_q baryons

Ξ_q : Qsd or Qsu. (sd), (sd) in spin-0

→ Ξ_q mass given by

$$\Xi_q = m_q + m_s + m_u - \frac{3v\langle\delta(r_{us})\rangle}{m_u m_s}$$

Can obtain (bsd) mass from (csd) + shift in HF:

$$\Xi_b = \Xi_c + (m_b - m_c) - \frac{3v}{m_u m_s} \left(\langle\delta(r_{us})\rangle_{\Xi_b} - \langle\delta(r_{us})\rangle_{\Xi_c} \right)$$

several options for obtaining $m_b - m_c$ from data:

$$m_b - m_c = \Lambda_b - \Lambda_c = 3333.2 \pm 1.2 \text{ MeV}$$

$$m_b - m_c = \left(\frac{2\Sigma_b^* + \Sigma_b + \Lambda_b}{4} - \frac{2\Sigma_c^* + \Sigma_c + \Lambda_c}{4} \right) = 3330.4 \pm 1.8 \text{ MeV}$$

- The Ξ_Q (Qsq) baryons contain an s quark
- Q mass differences depend on the spectator
- optimal estimate from mesons which contain both s and Q:

$$m_b - m_c = \left(\frac{3B_s^* + B_s}{4} - \frac{3D_s^* + D_s}{4} \right) = 3324.6 \pm 1.4 \text{ MeV}$$

ABSTRACT

The recent observation by CDF of Σ_b^\pm (uud and ddb) baryons within 2 MeV of the predicted $\Sigma_b - \Lambda_b$ splitting has provided strong confirmation for the theoretical approach based on modeling the color hyperfine interaction. We now apply this approach to predict the masses of the Ξ_b family of baryons with quark content usb and dsb – the ground state Ξ_b at 5790 to 5800 MeV, and the excited states Ξ'_b and Ξ''_b . The main source of uncertainty is the method used to estimate the mass difference $m_b - m_c$ from known hadrons. We verify that corrections due to the details of the interquark potential and to $\Xi_b - \Xi'_b$ mixing are small.

Observation and Mass Measurement of the Baryon Ξ_b^-

(CDF Collaboration)

We report the observation and measurement of the mass of the bottom, strange baryon Ξ_b^- through the decay chain $\Xi_b^- \rightarrow J/\psi \Xi^-$, where $J/\psi \rightarrow \mu^+ \mu^-$, $\Xi^- \rightarrow \Lambda \pi^-$, and $\Lambda \rightarrow p \pi^-$. A signal is observed whose probability of arising from a background fluctuation is 6.6×10^{-15} , or 7.7 Gaussian standard deviations. The Ξ_b^- mass is measured to be $5792.9 \pm 2.5(\text{stat}) \pm 1.7(\text{syst}) \text{ MeV}/c^2$.

Ξ_b^- masses

Ξ_b^* , Ξ'_b mass prediction

Ξ'_b : bsd with (sd) in S=1; total spin = 1/2

Ξ_b^* : bsd with (sd) in S=1; total spin = 3/2

spin-averaged mass of these two states

$$\frac{2\Xi_q^* + \Xi'_q}{3} = m_q + m_s + m_u + \frac{v \langle \delta(r_{us}) \rangle}{m_u m_s}$$

so that

$$\frac{2\Xi_b^* + \Xi'_b}{3} = \frac{2\Xi_c^* + \Xi'_c}{3} + (m_b - m_c) + \frac{2\Xi_c^* + \Xi'_c - 3\Xi_c}{12} \left(\frac{\langle \delta(r_{us}) \rangle_{\Xi_b}}{\langle \delta(r_{us}) \rangle_{\Xi_c}} - 1 \right)$$

Ξ_b^* , Ξ'_b mass prediction

$$(2\Xi_b^* + \Xi'_b)/3$$

	$m_b - m_c =$	$\Lambda_b - \Lambda_c$	$\Sigma_b - \Sigma_c$	$B_s - D_s$

Observation of the Ω_b^- Baryon and Measurement of the Properties of the Ξ_b^- and Ω_b^- Baryons

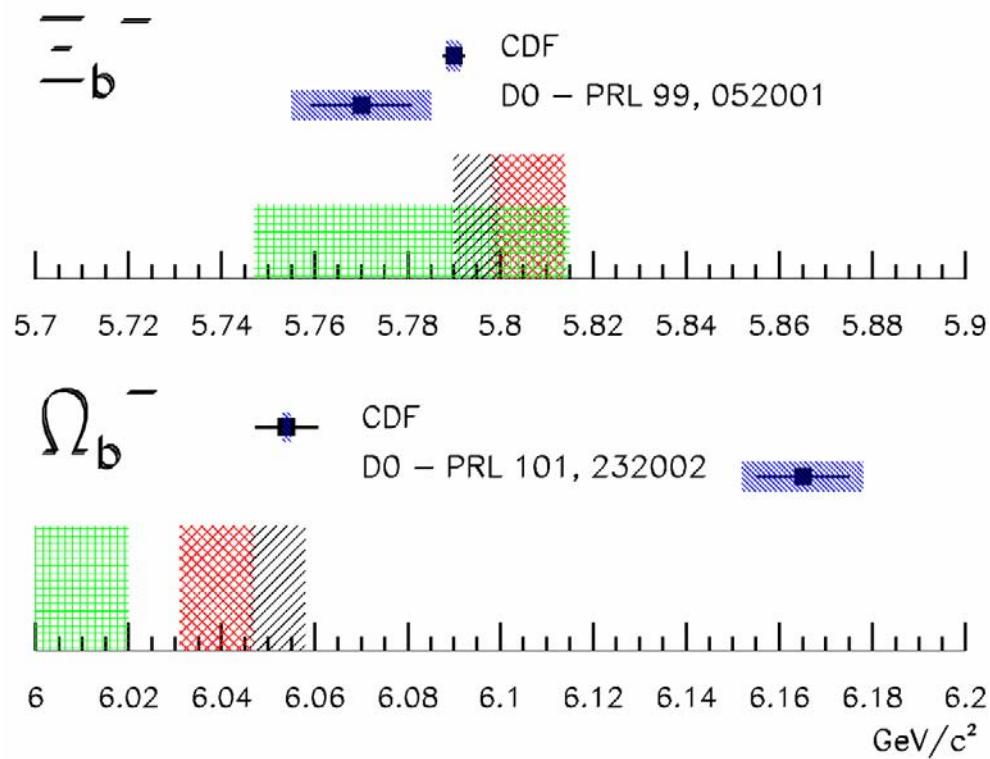

CDF Collaboration

We report the observation of the bottom, doubly-strange baryon Ω_b^- through the decay chain $\Omega_b^- \rightarrow J/\psi \Omega^-$, where $J/\psi \rightarrow \mu^+ \mu^-$, $\Omega^- \rightarrow \Lambda K^-$, and $\Lambda \rightarrow p \pi^-$, using 4.2 fb^{-1} of data from $p\bar{p}$ collisions at $\sqrt{s} = 1.96 \text{ TeV}$, and recorded with the Collider Detector at Fermilab. A signal is observed whose probability of arising from a background fluctuation is 4.0×10^{-8} , or 5.5 Gaussian standard deviations. **The Ω_b^- mass is measured to be $6054.4 \pm 6.8(\text{stat.}) \pm 0.9(\text{syst.}) \text{ MeV}/c^2$.** The lifetime of the Ω_b^- baryon is measured to be $1.13^{+0.53}_{-0.40}(\text{stat.}) \pm 0.02(\text{syst.}) \text{ ps}$. In addition, for the Ξ_b^- baryon we measure a mass of $5790.9 \pm 2.6(\text{stat.}) \pm 0.8(\text{syst.}) \text{ MeV}/c^2$ and a lifetime of $1.56^{+0.27}_{-0.25}(\text{stat.}) \pm 0.02(\text{syst.}) \text{ ps}$. Under the assumption that the Ξ_b^- and Ω_b^- are produced with similar kinematic distributions to the Λ_b^0 baryon, we find $\frac{\sigma(\Xi_b^-)\mathcal{B}(\Xi_b^- \rightarrow J/\psi \Xi^-)}{\sigma(\Lambda_b^0)\mathcal{B}(\Lambda_b^0 \rightarrow J/\psi \Lambda)} = 0.167^{+0.037}_{-0.025}(\text{stat.}) \pm 0.012(\text{syst.})$ and $\frac{\sigma(\Omega_b^-)\mathcal{B}(\Omega_b^- \rightarrow J/\psi \Omega^-)}{\sigma(\Lambda_b^0)\mathcal{B}(\Lambda_b^0 \rightarrow J/\psi \Lambda)} = 0.045^{+0.017}_{-0.012}(\text{stat.}) \pm 0.004(\text{syst.})$ for baryons produced with transverse momentum in the range of $6 - 20 \text{ GeV}/c$.

b-baryons

Fermilab Seminar – May, 2009

b–baryons spectrum – TH predictions vs EXP

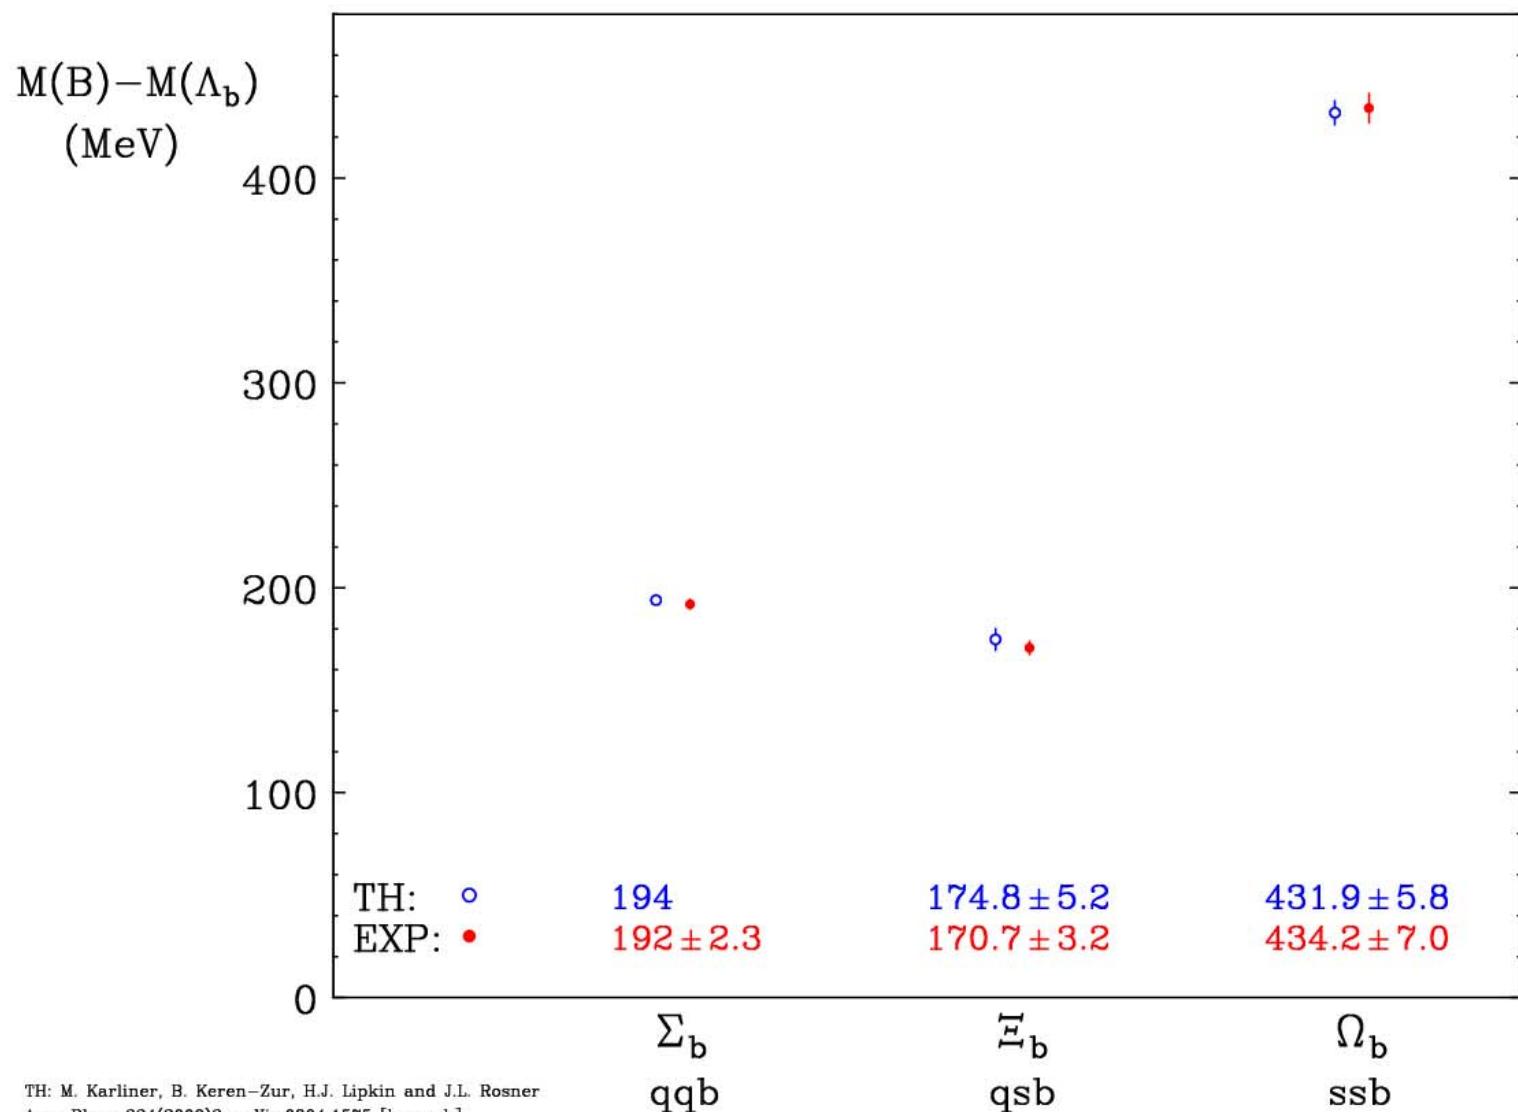

Table 10: Comparison of predictions for b baryons with those of some other recent approaches [6, 10, 11] and with experiment. Masses quoted are isospin averages unless otherwise noted. Our predictions are those based on the Cornell potential.

Quantity	Value in MeV				
	Refs. [6]	Ref. [10]	Ref. [11]	This work	Experiment
$M(\Lambda_b)$	5622	5612	Input	Input	5619.7 ± 1.7
$M(\Sigma_b)$	5805	5833	Input	—	5811.5 ± 2
$M(\Sigma_b^*)$	5834	5858	Input	—	5832.7 ± 2
$M(\Sigma_b^*) - M(\Sigma_b)$	29	25	Input	20.0 ± 0.3	$21.2_{-2.1}^{+2.2}$
$M(\Xi_b)$	5812	5806 ^a	Input	5790–5800	5792.9 ± 3.0^b
$M(\Xi_b')$	5937	5970 ^a	5929.7 ± 4.4	5930 ± 5	—
$\Delta M(\Xi^b)^c$	—	—	—	6.4 ± 1.6	—
$M(\Xi_b^*)$	5963	5980 ^a	5950.3 ± 4.2	5959 ± 4	—
$M(\Xi_b^*) - M(\Xi_b')$	26	10 ^a	20.6 ± 1.9	29 ± 6	—
$M(\Omega_b)$	6065	6081	6039.1 ± 8.3	6052.1 ± 5.6	—
$M(\Omega_b^*)$	6088	6102	6058.9 ± 8.1	6082.8 ± 5.6	—
$M(\Omega_b^*) - M(\Omega_b)$	23	21	19.8 ± 3.1	30.7 ± 1.3	—
$M(\Lambda_{b[1/2]}^*)$	5930	5939	—	5929 ± 2	—
$M(\Lambda_{b[3/2]}^*)$	5947	5941	—	5940 ± 2	—
$M(\Xi_{b[1/2]}^*)$	6119	6090	—	6106 ± 4	—
$M(\Xi_{b[3/2]}^*)$	6130	6093	—	6115 ± 4	—

^aValue with configuration mixing taken into account; slightly higher without mixing.

^bCDF [13] value of $M(\Xi_b^-)$.

^c $M(\text{state with } d \text{ quark}) - M(\text{state with } u \text{ quark})$.

Recent data from Belle:
anomalously large (2 orders of mag.)

$$\Upsilon(5S) \rightarrow \Upsilon(1S) \pi^+ \pi^-$$

$$\Upsilon(5S) \rightarrow \Upsilon(2S) \pi^+ \pi^-$$

0802.0649 [hep-ph], Lipkin & M.K.:
might be mediated by $\bar{b}b\bar{u}\bar{d}$ tetraquark
below $B\bar{B}$ threshold:

$$\Upsilon(mS) \rightarrow T_{\bar{b}b}^\pm \pi^\mp \rightarrow \Upsilon(nS) \pi^+ \pi^-$$

analogous to Z(4430)? Seen in $\psi' \pi^\pm$ but not in $J/\psi \pi^\pm$

- E and p conservation in $Y(5S) \rightarrow Y(mS)\pi\pi$:
plot of $M_{inv}[Y(mS)\pi]^2$ vs. E_π linear
modulo $Y(5S)$, $Y(mS)$ width
- Look for peaks in M_{inv} of $Y(mS)\pi$
- Isospin:
 $Y(mS)\pi^+$ vs. π^- = $Y(mS)\pi^-$ vs. π^+
modulo statistics

Unique signal for $b\bar{b}q\bar{q}$ and bbq double bottom baryons and bb tetraquarks

- $b \rightarrow c\bar{c}s \rightarrow J/\psi s$

so $bbq \rightarrow J/\psi J/\psi (ssq) \rightarrow J/\psi J/\psi \Xi$

similarly $b\bar{b}q\bar{q} \rightarrow J/\psi J/\psi (\bar{s}\bar{s}q\bar{q}) \rightarrow J/\psi J/\psi K\bar{K}$

and $bb\bar{q}\bar{q}$

With all final state hadrons coming from the same vertex

Unique signature but v. low rate - is there enough data?

Open questions

- need to understand the XYZ states in the charm sector and their counterparts in the bottom sector
- replacing charmed quark by bottom quark makes the binding stronger
- excellent challenge for EXP and TH
- general question of exotics in QCD
- **ccu, ccd** and **bbu, bbd**:
SELEX ccq data - isospin breaking much too large?

Summary

- Constituent quark model with color HF interaction gives highly accurate predictions for heavy baryon masses
- a challenge for theory: derivation from QCD
- constituent quark masses depend on the spectator quarks
- $M_{\Sigma_b} - M_{\Lambda_b} = 194 \text{ MeV}$ vs 192 in EXP (CDF)
- $M(\Sigma_b^*) - M(\Sigma_b) = 22 \text{ MeV}$ vs 21 MeV in EXP (CDF)
- $\mu_{\Lambda_c} = 0.43 \text{ n.m.}$ | $\mu_{\Lambda_b} = -0.067 \text{ n.m.}$
- meson-baryon effective supersymmetry
- meson/baryon HF splitting confirms Cornell potential
- Ξ_b, Ω_b mass predictions: better than 3 MeV
- puzzle in $Y(5S)$ decays: $\bar{b}b u \bar{d}$ candidates?
